UAply Bots on Your Computer

Four read-only helpers that live in the Claude desktop app on your PC. They check that UAply's job sources and code are healthy, and they scout new job boards and startup funding, then leave a short report for you to read.

BOT	WHAT IT DOES	PROPOSED SCHEDULE	REPORT IT WRITES
Feed health check	Opens every employer job board UAply reads (Greenhouse, Lever and Ashby boards, including One Medical, Oscar Health, Dental365 and Wilson Elser) and flags any board that is down or empty, with the exact error.	Mondays and Thursdays, 7:10 AM	feed-health-[date].md
Code checks	Runs the repository's own check script (JavaScript syntax, sandbox and dev patches, legal pages, Python lint, hosted copies) and lists any failure, the current branch and uncommitted files. It never tries to fix anything.	Every day, 7:20 AM	checks-[date].md
Board scout	Finds and verifies new public job boards with health care, dental or legal roles, Philadelphia region first, and skips boards UAply already reads. Only boards it confirmed that day are reported.	Mondays, 8:00 AM	board-scout-[date].md
Funding scout	Tracks startup credits (Cloudflare, AWS, Microsoft, Google), open grants (Hello Alice), free advising (SCORE, Small Business Development Centers) and Philadelphia pitch competitions (Drexel, Temple, Penn). Lists deadlines in the next 60 days and what changed.	Mondays, 8:00 AM	funding-scout-[date].md

Reports are saved in Documents\uaply-bot-reports. Today the bots run only when you press Run now; the schedule above starts once you approve it.

Safety rules every bot follows

- **Read-only.** No edits, commits, pushes or branch changes in the UAply repository.
- **No outside actions.** No sign-ups, form submissions, purchases, emails or messages.
- **Verified facts only.** The scouts confirm each job board or program on its own page before reporting it, and say when a number comes from a third-party site.
- **Plain reports.** Each run leaves one short text file you can open, forward or delete.

Why they stay light on your computer

- They run inside the Claude app only while it is open. A run that was due while the app was closed happens at the next launch.
- Each run is one checklist and one report, then it stops. The research bots cap themselves at about 20 to 25 web lookups.
- Heavy research runs weekly; the quick checks run daily or twice a week, and the times are spread out so runs do not overlap.
- The code check reuses the repository's existing script, so nothing new is installed.

How to start using them

- Open **Scheduled** in the Claude sidebar. The four bots are listed as UAply bot: feed health, code checks, board scout and funding scout.
- Press **Run now** on each bot once and approve the tools it asks for. Approvals are saved, so later runs do not stop to ask.
- Read the results in **Documents\uaply-bot-reports**.
- To turn on the schedule, approve it in Claude, or set your own times when editing a bot in the app.

Ideas for more bots (not built yet)

- **University outreach researcher:** finds career-center and co-op contacts at Drexel, Temple and Penn and drafts emails for you to review. It never sends.
- **Listing quality checker:** samples live job cards and flags a wrong field, license or location.
- **Uptime watcher:** checks that the hosted sandbox and dev links load, and records how long they take.
- **Weekly product digest:** what changed in the sandbox this week and what is waiting for your approval.
